

Onboard Instrument Processing Operations Concepts for the HypIRI Mission

Steve Chien, David McLaren
Jet Propulsion Laboratory, California Institute of Technology

Daniel Mandl, Goddard Space Flight Center

Jerry Hengemihle, Microtel LLC

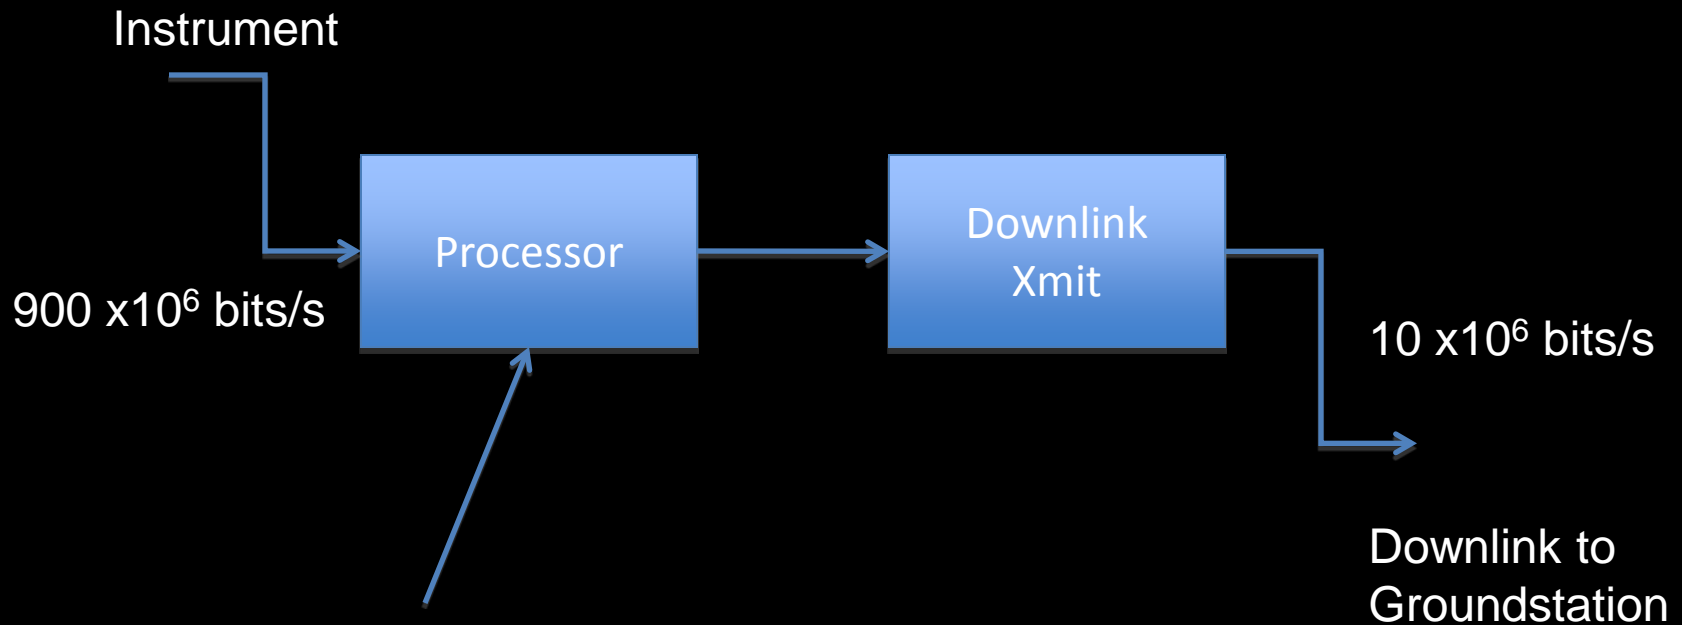

Direct Broadcast Heritage

- Direct Broadcast is a technology which enables downlink of instrument data during acquisition (e.g., MODIS)
- In current use, DB downlinks all of the data acquired by the instrument

HyspIRI Direct Broadcast

- HyspIRI TIR + VSWIR will produce 900×10^6 bits per second (raw uncompressed)
- In order to use heritage technology groundstations HyspIRI DB will have an effective rate of 10×10^6 bits per second (uncompressed)
 - Even assuming 2:1 compression we have a 45x oversubscription

HyspIRI DB Concept

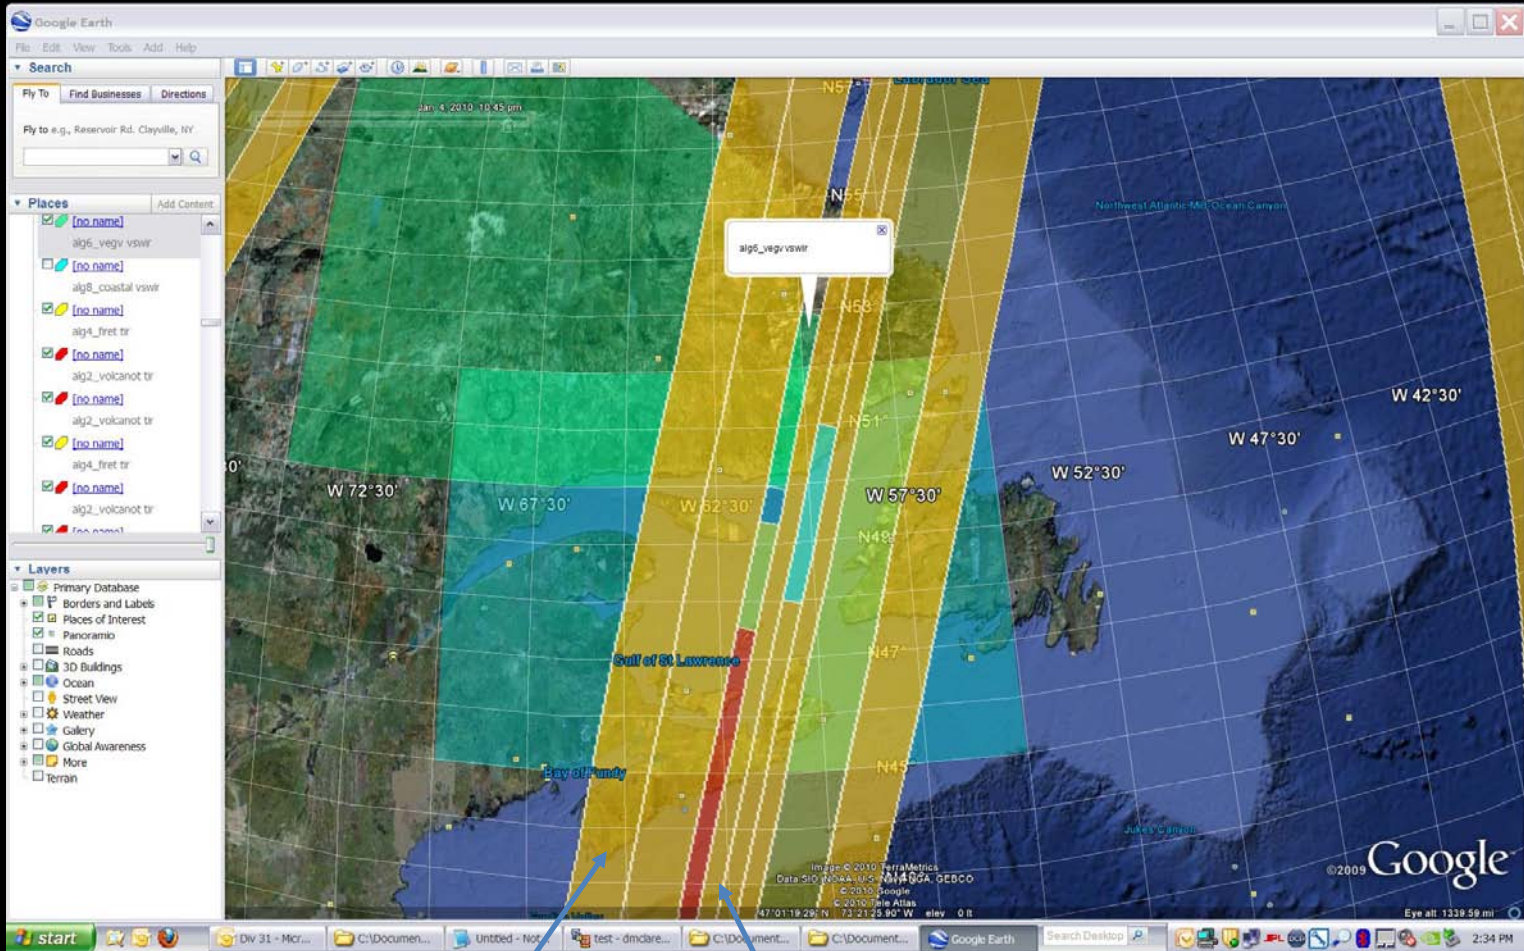

Powerful Space processor
currently evaluating
Spacecube 2.0, OPERA, I-Board

Operations for HypsIRI DB

- Users specify “areas of interest” which are
 - geographical regions (polygon on surface of Earth)
 - product, (e.g. normalized burn index)
 - priority, (e.g. 50 on 1-100 scale)
 - Constraint (sun must be at least 20 degrees above horizon)
- For each product, consider:dl bands, dl product
- In generic tool (e.g. Google Earth)

Instrument Swaths

4 x 112.5 km wide – TIR only

4 x 37.5 km wide – VSWIR + TIR

How much can we get down DB?

- 10×10^6 bits/s DB downlink = ?
- 1 band @ 14 bits (uncompressed) =
 - 3.2×10^6 bits/s 1 band 112.5km (unc)
 - 1.0×10^6 bits/s 1 band 37.5km (unc)
- Assuming 2:1 lossless comp
- ~20 small swaths bands or ~6 large
- Can also downsample spatially
- Considerable leverage from products

Automated Operations Planning

- Automated Planning tool selects highest priority products while respecting
 - Visibility (instrument swaths)
 - Onboard CPU limits
 - Downlink data limits
- Result is a time ordered sequence of commands to process instrument data from each of 8 instrument swaths

Sample Plans

The screenshot displays the Google Earth interface with a sample plan overlaid on a satellite view of a coastal region. The plan consists of several red-shaded polygonal areas and a central dark green area. A grid of latitude and longitude coordinates is overlaid on the map, with labels such as N10°45', N10°15', N9°45', N9°15', N8°45', N8°15', E98°45', E99°15', E99°45', E100°15', E100°45', E101°15', E101°45', E102°15', and E103°15'. A popup window is open over the plan, displaying the following data:

```
Sens=4  
startTime: 21 Jun 2009  
03:57:50 (124556670)  
endTime: 21 Jun 2009  
03:58:00 (124556680)  
coastalV  
coastalT  
fireV  
volcanoT
```

The interface includes a search bar, a 'Places' sidebar with 'solution1_schedule.kml' selected, and a 'Layers' sidebar with 'Primary Database' and 'Borders and Labels' checked. The bottom status bar shows the date 'Jun 21, 2009 11:59 pm', coordinates '9°24'32.82" N 100°33'57.97" E', and an elevation of '0 ft'. The Google logo and '© 2009' are visible in the bottom right corner.

More Plans

The screenshot displays the Google Earth application window. The main view is a globe with a complex network of red lines representing flight routes. The routes are concentrated in the Pacific and Atlantic oceans, connecting major hubs. A yellow line highlights a specific path across the Atlantic. The interface includes a search bar at the top left, a 'Places' list on the left side, and a 'Layers' panel at the bottom left. The 'Places' list shows a 'Temporary Places' folder containing a file named 'solution1_schedule.kml'. The 'Layers' panel shows various map features like 'Borders and Labels', 'Places', 'Panoramio Photos', 'Roads', '3D Buildings', 'Ocean', 'Street View', 'Weather', 'Gallery', 'Global Awareness', and 'Terrain'. The bottom of the window shows the Windows taskbar with the 'start' button and several open applications.

HyspIRI DB Applications

- Volcanos
- Fires
- Flooding
- Cryosphere
- Ocean

- Applications allows spatial and spectral subsampling (bands and products) to reduce needed downlink volume

Heritage (onboard) – EO-1/ASE Thermal Detection

- EO-1

- Onboard thermal event detection in use since 2004 using onboard Hyperion spectral signature
- Uses spectral slope in 1.65-2.28 μ (HyspIRI VSWIR)
- Onboard event detection can trigger:
 - Subsequent imaging
 - Alert Notices
 - Generation of thermal summary and quicklook context images
 - Ground-based automatic data product generation and distribution

Heritage – ground-based MODIS Active Fire Detection

- Detects hotspots using
 - absolute threshold
 - $T_4 > 360K, 330K(\text{night})$ or
 - $T_4 > 330K, 315K(\text{night})$
and $T_4 - T_{11} > 25K(10K @ \text{night})$
 - and relative threshold
 - $T_4 > \text{mean}(T_4) + 3\text{stddev}(T_4)$
and $T_4 - T_{11} > \text{median}(T_4 - T_{11}) + 3\text{stddev}(T_4 - T_{11})$
 - 4μ and 11μ available on HypIRI TIR

Looks for areas significantly hotter than surrounding area (requires 6 surrounding pixels cloud, water, fire free \rightarrow 21x21)

Fires – Burn Scar

Visible and burn scar
enhanced images from
ALI instrument on EO-1
of Station Fire near Los
Angeles 03 September
2009

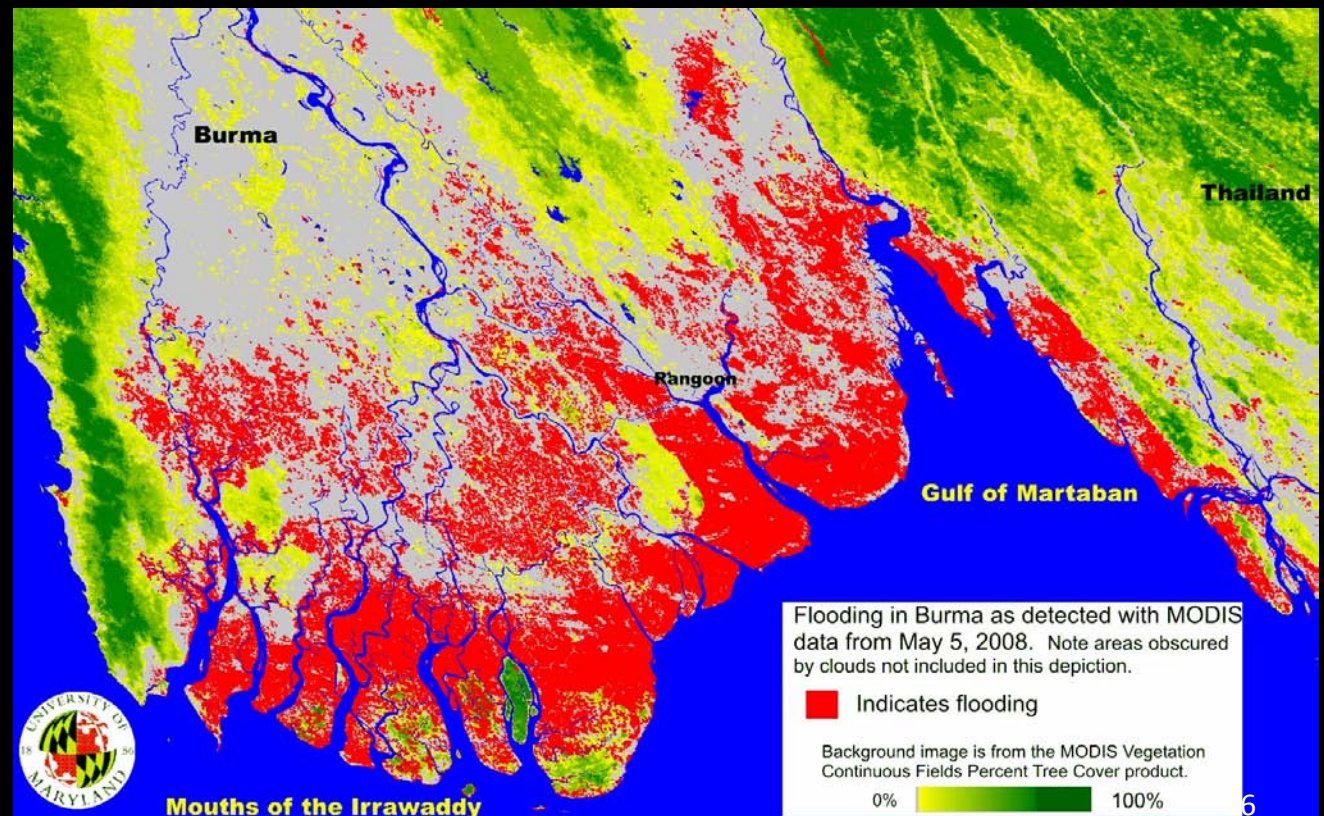

Images courtesy EO-1
Mission NASA GSFC

Burn scar:
0.76-0.90 μm ,
2.08-2.35 μm
Both VSWIR

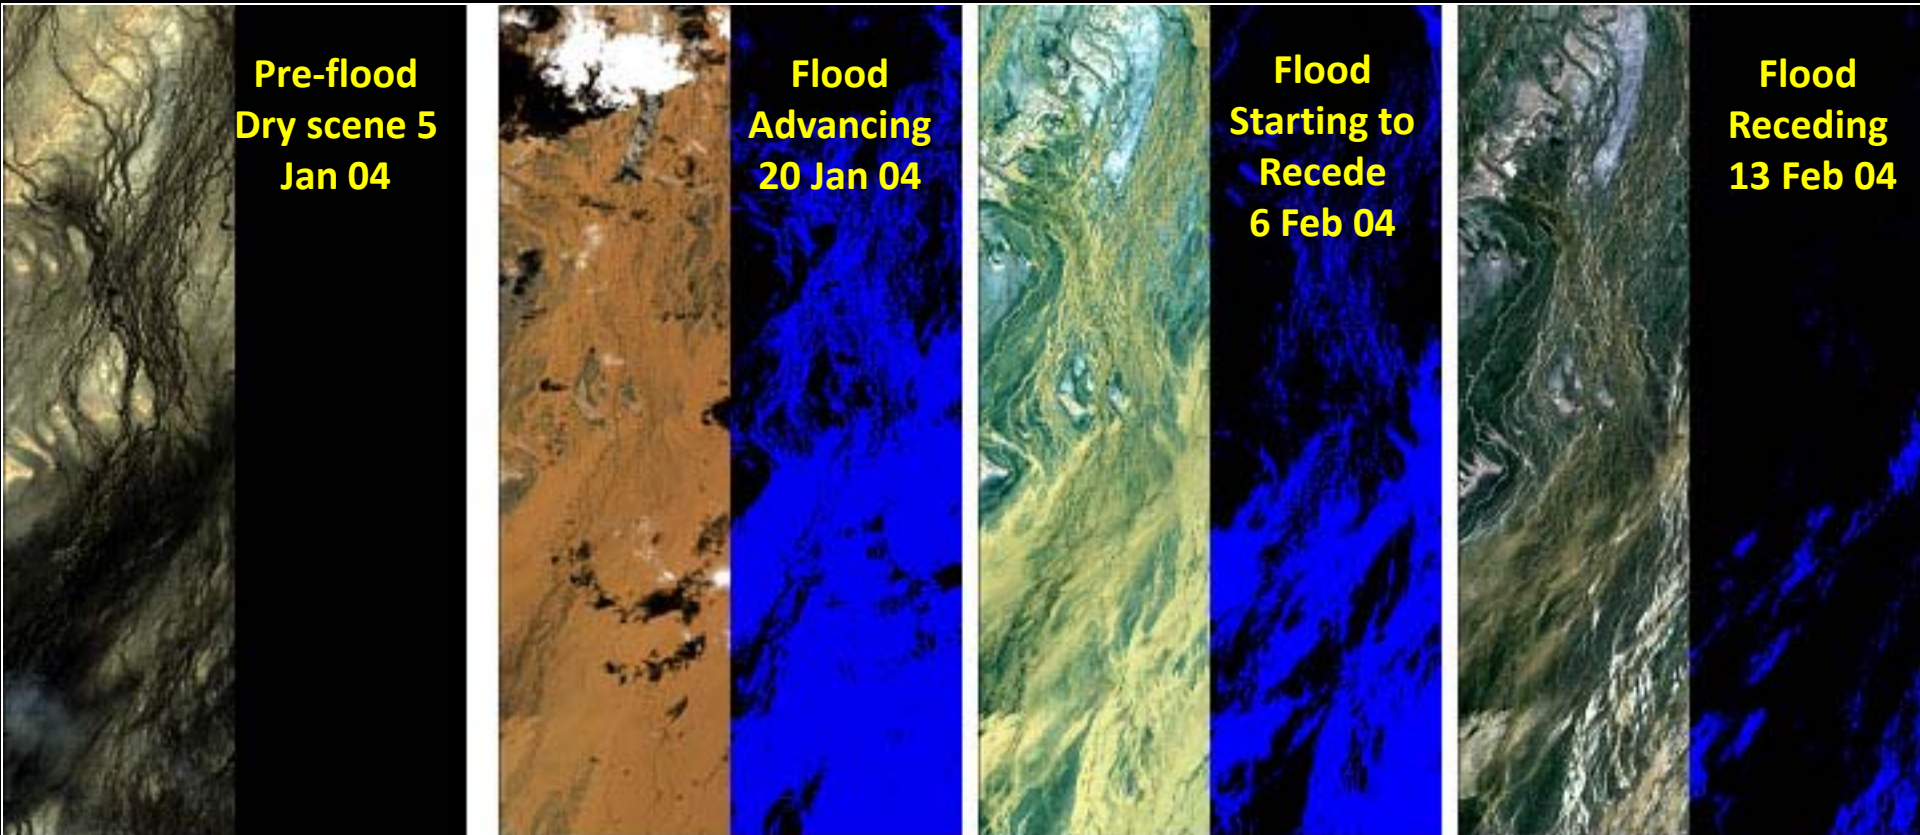

Flooding – Heritage (Ground) MODIS/UMD

- UMD Flood tracking of Myanmar using MODIS bands 1,2,5,7 (620-2155 nm avail. on VSWIR)

Flooding - Heritage (Flight) – EO-1/ASE

Onboard Detection of a Rare Major Flood on Australia's Diamantina River

Cause of flooding: Monsoonal rain

EO-1 Hyperion. Wavelengths used: 0.86 μm and 0.99 μm (also 0.55 μm , 0.86 μm) available on VSWIR

F. Ip, V. Baker, et al., University of Arizona¹⁷

Cryosphere (Ground)

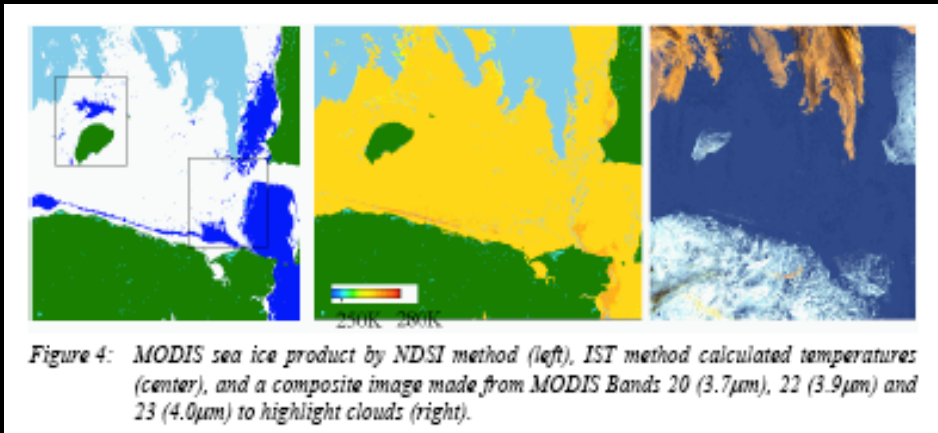

Image courtesy of [Scharfen and Kalsa 2003]

Figure 1 MODIS at-satellite reflectance image from swath of MOD02HKM for 3 January 2003 (A). Snow cover appears as yellow in this display of bands 1, 4 and 6. Snow cover map of the swath (B) and the snow cover map in sinusoidal projection (C).

Courtesy of MODIS Snow Products User Guide

MODIS Snow product algorithms will require both VSWIR and TIR

Heritage (onboard) EO-1/ASE Hyperion Cryosphere Classifier

Deadhorse (Prudhoe Bay), Alaska

- Snow
- Water
- Ice
- Land
- Unclassified

EO1/Hyperion data

Wavelengths used in classifier:

0.43, 0.56, 0.66, 0.86 and 1.65 μm (all avail. VSWIR)

Arizona State University
Planetary Geology Group

Coastal

Maximum Chlorophyll Index derived from Hyperion imagery acquired 21 October 2008 of Monterey Bay [Chien et al. 2009] using 660, 681, 711, 752, nm. (ack J. Ryan/MBARI) These bands avail. VSWIR

Uses 490nm/555nm or 490nm/565 nm MODIS reflectance data
Courtesy GSFC DAAC

Again avail. VSWIR.

Dust

Image (processed MODIS) courtesy of *Satellite Product Tutorials: Desert Dust Storms*, S. Miller et al.
Algorithms would require both VSWIR and TIR bands.

Vegetation

Fig. 3. Comparison of selected indices derived from 6 July Airborne Visible/Infrared Imaging Spectrometer (AVIRIS) imagery (18-m spatial resolution) with locations of N trial plots and subpixel plots shown. The corresponding classification accuracies are shown in Table 7. Note the differences between the appearance of the subpixel areas and the classification accuracies. For example, the subpixel stressed areas for the Normalized Difference Vegetation Index (NDVI) and the Modified Chlorophyll Absorption in Reflectance Index (MCARI) are quite apparent, although the classification accuracies (Table 7) for the Photochemical Reflectance Index (PRI) are generally higher.

Aviris measurement of plant stress using NDVI, MCARI, and PRI [Perry & Roberts 2008] describes 22 measures using 500-1200 nm. These bands are available in VSWIR data.

Conclusions

- Direct broadcast can provide key data at low latency
- Onboard computing can address issues to downselect and process data to fit within reduced downlink
- Operations can be simple and automated
